SUMMARY

QA Lead and SDET with 8+ years across AI-native SaaS, consumer mobile, and enterprise CRM/CLM platforms — repeatedly the person who builds a quality function where none existed. Currently the sole quality gatekeeper at SuperAGI, where I built the Python/Playwright automation framework, review every PR before merge, own every production deployment, and hold a near-zero production defect rate. Automation background spans Python/Playwright/Pytest and Java/Selenium/REST Assured, with BDD (Cucumber/Serenity) and deep enterprise integration testing across Salesforce, DocuSign, and Outlook. Scaled a QA function from 3 to 11 engineers across 4 pods and established STLC, release governance, and quality reporting from scratch.

CORE SKILLS

Test Automation Python, Playwright (UI + API), Pytest, Page Object Model, pytest-bdd / Cucumber (Gherkin), Serenity BDD, Java, Selenium WebDriver, TestNG / JUnit, REST Assured, Postman + Newman

CI/CD & Reporting Jenkins, GitHub Actions, Git, Allure, Serenity Reports, parallel & tag-driven execution

Database & Backend SQL (MySQL / PostgreSQL), data validation, JSON schema & payload validation, webhook and event-ingestion testing

Testing Types Functional, Exploratory, End-to-End, Regression, API, Integration, Mobile SDK (iOS & Android), Web SDK, Usability, Release Validation

Leadership QA team scaling (11+), pod ownership, hiring & mentoring, sprint quality governance, defect triage, RCA, stakeholder reporting

Methodologies Agile/Scrum, STLC, Risk-Based Testing, Shift-Left QA, Release Management

Tools & Integrations JIRA, Zephyr Scale, Confluence, Charles Proxy, Salesforce, DocuSign, Outlook, Shopify/Magento, FCM/APNS, WhatsApp Business API, Android Studio, Xcode, Linux CLI

PROFESSIONAL EXPERIENCE

SuperAGI Bangalore, India

AI-native CRM platform automating sales, outreach, and customer engagement through intelligent agents and multi-channel workflows.

Senior QA Engineer (QA Lead) | November 2025 – Present

- Sole owner of production quality across 4 engineering pods — review every PR before merge, make the final ship decision, and own all production deployments; maintained a near-zero production defect rate [ADD: across how many releases?].
- Designed and built the company's **Python + Playwright automation framework from scratch** (Pytest, Page Object Model, fixture-based test data) covering critical web UI and REST API flows — [ADD: roughly how many tests?] running on every merge via Jenkins CI/CD.
- Built the API automation layer for backend and service validation — request/response assertions, auth and token handling, JSON schema validation, and programmatic test data setup/teardown, cutting manual regression effort by [ADD: % or hours saved].
- Ran a company-wide Bug Bash surfacing **1,100+ issues** across frontend, backend, and integrations; drove the triage and remediation programme that reduced production defects by **~80%**.
- Scaled the QA team from **3 to 11 engineers** — defined pod-level ownership, sprint quality accountability, onboarding, and mentoring across 4 engineering pods.
- Established STLC from scratch — sprint test plans, entry/exit criteria, defect SLA tracking, and weekly quality dashboards reported directly to product leadership.
- Introduced AI-assisted test authoring (Cursor, Claude Code) across the QA team, keeping automation coverage ahead of a fast release cadence; lead all Agile ceremonies as Scrum facilitator and own defect triage and RCA with engineering and product leadership.

WebEngage Bangalore / Mumbai, India

Customer engagement and retention platform serving 800+ global brands — multi-channel automation via Push, Email, SMS, WhatsApp, and In-App messaging.

Senior QA Engineer | October 2022 – November 2025

- Led QA for the Mobile SDK, Personalization Engine, and Shopify pods; owned go/no-go release decisions and **reduced production issues by ~90% over 3 years**.
- Automation (BDD)**: authored Gherkin feature files and step definitions in the team's **Cucumber + Serenity BDD** framework (Java, Selenium WebDriver, REST Assured), building automated regression coverage for the **Onsite Notifications** and **Onsite Surveys** modules — trigger and targeting rules, segment-based audience selection, display and frequency-capping logic, cross-browser rendering, and response/event capture.
- Worked within a tag-driven, multi-environment automation suite (Prod US, Prod IN, Staging) executing on Jenkins scheduled regression — Serenity reporting with failure screenshots, embedded API request/response logs, and JIRA-linked known production issues.
- Validated event ingestion and campaign delivery through REST API checks and SQL queries against platform datastores — payload validation, attribute sync, segment-membership and journey-trigger accuracy, and webhook retry/idempotency.
- Introduced the release sprint system** and owned release management end to end — coordinated engineering, product, and DevOps, validated deployment readiness, and signed off production pushes.

- Led hands-on testing of consumer mobile experiences (iOS & Android SDKs and Web SDK) — push, in-app, and email journeys as the end user receives them, across devices, OS versions, and degraded networks; used Charles Proxy to intercept and validate SDK traffic, headers, payload encryption, and error handling.
- Owned multi-channel testing: FCM/APNS Push, In-App, Email (SMTP/API), SMS (multi-aggregator), WhatsApp Business API — frequency capping, DND rules, and fallback routing; plus Shopify plugin QA covering install/uninstall, abandoned-cart triggers, event tracking, and order accuracy.

QA Engineer | October 2020 – September 2022

- **First QA engineer on the team** — joined when there were no processes, no test cases, and no quality infrastructure; built the QA function from scratch alongside the founding engineering team, then hired, onboarded, and mentored the QA engineers who followed.
- Designed and executed the first test suites for the Mobile SDK (iOS & Android), Web SDK, and Personalization Engine — SDK initialization, event tracking, user attributes, and content rendering; validated SSL-pinned SDK traffic with Charles Proxy and reproduced network-failure edge cases on real devices.
- Tested Journey Builder from initial release — branching logic, wait nodes, event triggers, and A/B variant routing; ran integration testing across SMS, Email, WhatsApp, Shopify, and Magento as each channel launched.

Ultria Software Bangalore / Mumbai, India

Enterprise Contract Lifecycle Management suite built on Salesforce — “request to renewal” contract automation with dynamic contract assembly, clause libraries, and approval routing, delivered to enterprise clients alongside TMS (Tenant Management System) for per-tenant configuration.

Quality Analyst | October 2019 – September 2020

- **Primary QA owner of the Salesforce-native CLM product from zero** — built coverage module by module as the product was developed: contract creation from Opportunity, dynamic contract assembly, clause library and template management, approval routing, versioning, and the full request-to-renewal lifecycle in Salesforce Lightning.
- Owned integration testing across DocuSign e-signature (envelope generation, multi-signatory routing, signer authentication, webhook callbacks, signed-document write-back), the Outlook Add-In (contract drafting from email threads, attachment parsing, CRM record linkage), and the iOS/Android mobile apps — plus TMS, the multi-tenant admin product used to provision clients and configure per-tenant workflows, permissions, and data isolation.
- **Extended the team’s Java + Selenium WebDriver framework** (TestNG, Page Object Model, Maven) to cover **Salesforce Lightning** — shadow DOM on Lightning Web Components, dynamic element IDs, nested Visualforce iframes, lazy-loaded views, and async record commits — using fluent waits, custom ExpectedConditions, and centralised locators to stay stable across platform releases.
- Built **REST Assured API automation** — OAuth/token handling, reusable request-response specifications, JsonPath and JSON schema validation, and **chained end-to-end flows** (contract → approval → DocuSign envelope → status callback) with TestNG data providers for negative and boundary coverage.
- Authored test cases from SRS/CRS documentation; managed **200+ test cases** in Zephyr (JIRA); ran SQL validation across Salesforce, CLM, and DocuSign data stores.

Associate Analyst — Implementation & QA | February 2018 – September 2019

- Manual functional, regression, and exploratory testing through enterprise client implementation cycles; authored UAT scripts aligned to client business requirements and tracked defects in JIRA with RCA and reproduction steps.

KEY PROJECT

QA Automation Portfolio — Python · Playwright · Pytest · pytest-bdd · Allure · GitHub Actions

mohammadfaisal-qa.github.io (source code and live test reports public on GitHub)

- Built a full Python/Playwright test automation framework and the demo web application under test — Page Object Model, fixture-based authentication, Gherkin feature files, API and contract testing, network mocking for error-state validation, SQL data validation, and accessibility checks.
- Wired into GitHub Actions with parallel sharded execution and daily scheduled regression; Allure reports published publicly on every run, passing or failing.
- Published supporting QA Lead artefacts — test strategy with risk matrix, feature-level test plan, sample defect reports, and quality metrics with entry/exit criteria.

EDUCATION

Bachelor of Engineering — Electronics & Communication | 2018

IES IPS Academy, Indore | RGPV University
