4 engineering pods gatekept | QA team grown 3 to 11 | ~80% fewer production defects | 151-test public automation portfolio

SUMMARY

QA Lead and SDET with 8+ years across AI-native SaaS, consumer mobile, and enterprise CRM and CLM products. At SuperAGI I own quality outright: I built the Python and Playwright framework, review every pull request before it merges, and make the release call for four engineering pods. Before that I led QA at WebEngage for the Mobile SDK, Personalization and Shopify pods, having joined as their first QA hire. My automation background runs across Python, Playwright and Pytest as well as Java, Selenium and REST Assured, with Cucumber and Serenity on the BDD side.

CORE SKILLS

Test Automation Python, Playwright (UI + API), Pytest, Page Object Model, pytest-bdd / Cucumber (Gherkin), Serenity BDD, Java, Selenium WebDriver, TestNG / JUnit, REST Assured, Postman + Newman

CI/CD & Reporting Jenkins, GitHub Actions, Git, Allure, Serenity Reports, parallel and tag-driven execution

Database & Backend SQL (MySQL / PostgreSQL), data validation, JSON schema and payload validation, webhook and event-ingestion testing

Testing Types Automation Testing, Manual Testing, Functional, Regression Testing, End-to-End, API Testing, Integration, Exploratory, Mobile Application Testing (iOS & Android SDK), Web SDK, Cross-Browser Testing, Usability, Release Validation

Leadership QA team scaling (11+), pod ownership, hiring and mentoring, sprint quality governance, defect triage, RCA, stakeholder reporting

Process Agile / Scrum, SDLC, STLC, Test Case Design, Test Plans and Test Strategy, Defect Management, Risk-Based Testing, Shift-Left QA, Release Management

Tools & Integrations JIRA, Zephyr Scale, Confluence, Charles Proxy, Salesforce, DocuSign, Outlook, Shopify / Magento, FCM / APNS, WhatsApp Business API, Android Studio, Xcode, Linux CLI

PROFESSIONAL EXPERIENCE

SuperAGI Bangalore, India

AI-native CRM platform automating sales, outreach and customer engagement through intelligent agents and multi-channel workflows.

Senior QA Engineer | QA Lead | November 2025 - Present

- Sole quality gatekeeper for four engineering pods. Every pull request passes my review before it merges, I make the go/no-go call on each release, and I run the production deployment myself. The production defect rate has stayed **near zero** since I took it over.
- Built the company's Python and Playwright automation framework: Pytest, Page Object Model, fixture-based test data, tag-driven selection. It covers the critical web and REST API flows and runs on every merge through Jenkins.
- Wrote the API automation layer that replaced the manual regression pass we used to run before every release, covering auth and token handling, response assertions, JSON schema validation, and programmatic data setup and teardown.
- Ran a company-wide bug bash that surfaced **1,100+ issues** across frontend, backend and integrations, then drove the triage and fix programme that followed. Production defects fell by roughly **80%**.
- Grew the QA team from **3 engineers to 11**. Defined pod-level ownership and sprint quality accountability, and handled the hiring, onboarding and mentoring myself.
- Set up the STLC the company did not have: sprint test plans, entry and exit criteria, defect SLAs, and a weekly quality dashboard that goes to product leadership.
- Introduced AI-assisted test authoring (Cursor, Claude Code) across the team to keep coverage ahead of a fast release cadence.
- Facilitate the Agile ceremonies and own defect triage and RCA with engineering and product.

WebEngage Bangalore / Mumbai, India

Customer engagement and retention platform serving 800+ global brands across Push, Email, SMS, WhatsApp and In-App messaging.

Senior QA Engineer | October 2022 - November 2025

- Led QA for the Mobile SDK, Personalization Engine and Shopify pods, and owned the go/no-go decision on each release. Production issues dropped by around **90% over three years**.
- **Automation (BDD)**: wrote Gherkin features and step definitions in the team's **Cucumber and Serenity BDD** framework (Java, Selenium WebDriver, REST Assured), building regression coverage for the **Onsite Notifications** and **Onsite Surveys** modules: trigger and targeting rules, segment-based audience selection, display and frequency-capping logic, cross-browser rendering, and response capture.
- The suite was tag-driven and ran against Prod US, Prod IN and Staging on a Jenkins schedule, with Serenity reports carrying failure screenshots, embedded API logs and JIRA links to known production issues.
- Validated event ingestion and campaign delivery with REST API checks and SQL against the platform datastores: payload validation, attribute sync, segment membership, journey trigger accuracy, and webhook retry and idempotency.

- **Introduced the release sprint system** and owned release management end to end, coordinating engineering, product and DevOps through deployment readiness and production sign-off.
- Tested the consumer experience the way a user actually receives it: push, in-app and email journeys across devices, OS versions and degraded networks, with Charles Proxy on the SDK traffic to check headers, payload encryption and error handling.
- Multi-channel ownership across FCM and APNS push, in-app, email, SMS over multiple aggregators and WhatsApp Business API, including frequency capping, DND rules and fallback routing. Shopify plugin QA covered install and uninstall, abandoned-cart triggers, event tracking and order accuracy.

QA Engineer | October 2020 - September 2022

- **First QA engineer on the team.** No processes, no test cases, no quality infrastructure. I built the practice alongside the founding engineers, then hired and mentored the QA engineers who came after me.
- Designed the first test suites for the Mobile SDK (iOS and Android), Web SDK and Personalization Engine, covering SDK initialization, event tracking, user attributes and content rendering. Validated SSL-pinned traffic with Charles Proxy and reproduced network-failure cases on real devices.
- Tested Journey Builder from its first release: branching logic, wait nodes, event triggers and A/B variant routing. Ran the integration testing across SMS, Email, WhatsApp, Shopify and Magento as each channel launched.

Ultria Software Bangalore / Mumbai, India

Enterprise Contract Lifecycle Management suite built on Salesforce, covering request-to-renewal contract automation with dynamic assembly, clause libraries and approval routing, delivered alongside TMS for per-tenant configuration.

Quality Analyst | October 2019 - September 2020

- **Primary QA owner of the Salesforce-native CLM product**, building coverage module by module as it was developed: contract creation from Opportunity, dynamic assembly, clause library and template management, approval routing, versioning, and the full request-to-renewal lifecycle in Salesforce Lightning.
- Owned integration testing across DocuSign e-signature (envelope generation, multi-signatory routing, signer authentication, webhook callbacks, signed-document write-back), the Outlook Add-In and the iOS and Android apps. Also covered TMS, the multi-tenant admin product used to provision clients and configure per-tenant workflows, permissions and data isolation.
- Extended the team's **Java and Selenium WebDriver** framework (TestNG, Page Object Model, Maven) to handle Salesforce Lightning, which is hostile to automation: shadow DOM on Lightning Web Components, dynamic element IDs, nested Visualforce iframes, lazy-loaded views and async record commits. Fluent waits, custom ExpectedConditions and centralised locators kept it stable across platform releases.
- Built **REST Assured API automation** with OAuth and token handling, reusable request and response specifications, JsonPath and JSON schema validation, and chained end-to-end flows (contract, approval, DocuSign envelope, status callback). TestNG data providers drove the negative and boundary cases.
- Authored test cases from SRS and CRS documentation, managed **200+ test cases** in Zephyr, and ran SQL validation across the Salesforce, CLM and DocuSign data stores.

Associate Analyst, Implementation & QA | February 2018 - September 2019

- Manual functional, regression and exploratory testing through enterprise client implementation cycles. Wrote UAT scripts against client business requirements and tracked defects in JIRA with reproduction steps and root cause.

KEY PROJECT

Engage: Multi-Tenant Engagement Platform & QA Automation Framework Python, FastAPI, Playwright, Pytest, pytest-bdd, Allure, GitHub Actions
mohammad-faisal-qa.github.io | github.com/mohammad-faisal-qa/engage-app | [/engage-test-automation](#) (live app, source and public test reports)

- I built the application first, so the framework would have a target worth testing: Python, FastAPI, SQLAlchemy and PostgreSQL behind a vanilla JS front end, with **8 modules, 43 REST endpoints and 11 tables**, JWT auth, role-based access and multi-tenant isolation. Async sends, idempotent webhooks and a frequency-capping rules engine are in there on purpose, because they are genuinely hard to automate against.
- The suite over it is **151 tests**: a Service Object Model over httpx with typed Pydantic responses, Page Object Model for the browser layer, 16 pytest-bdd scenarios, consumer-driven contract tests against the generated OpenAPI schema, and request interception to force the error states the app will not produce on demand. It runs **four-way parallel in under four minutes**.
- Three GitHub Actions workflows: a pull-request gate that publishes Allure reports with trend history even when the run is red, a nightly reset of the public demo, and a read-only run against production thirty minutes later that doubles as an uptime check.
- Five defects found, filed and closed, with severity and priority tracked separately. One was **re-rated Medium to High** once an intermittent CI failure gave me evidence the first triage did not have. One was **against my own framework**: a wait that could never fail. One was a destructive-reset risk I closed with a guard on the health endpoint, plus seven tests covering the guard itself.
- Documented the way a QA lead should: test strategy with a ten-risk matrix, a feature-level test plan, five quality metrics each with a note on how it gets gamed, and 24 design decisions recorded with the alternative I rejected and what the choice cost.

EDUCATION

Bachelor of Engineering, Electronics & Communication | 2018

IES IPS Academy, Indore | RGPV University
